Note: The author desires to express his appreciation to the independent and chain store wholesale distributing agencies and the National Association of Food Chains, whose cooperation made this report possible. Acknowledgment is made of the helpful advice and assistance of E. W. Cake, Agricultural Econommst in the Farm Credit Administration (now on leave in the military service) in the preparation of the present report. A preliminary report relating to the retail distribution of dry beans will be prepared later by Wr. Cake, who conducted this phase of the study.

^{1/} This report covers one phase of a study undertaken by the Cooperative Research and Service Division, pertaining to the organization and operation of producers cooperative bean marketing associations, which will be published later in bulletin form.

Producers cooperative bean marketing associations occupy an important place in the sale and distribution of this country's dry bean crop. Operating in all the principal bean-producing States, these cooperatives handle as much as a fifth of the total United States crop for some 20,000 producers. Some of these cooperative groups have stressed the need for more information regarding the demand for various types or commercial classes of dry beans in different sections of the United States. With a view to assisting in the development of pertinent information in relation to this question, the Cooperative Research and Service Division undertook a survey of the distribution of dry beans in bulk and canned dry beans by wholesale grocery agencies in the United States during the year ended June 30, 1940. It will be apparent to the cooperatives concerned and to others receiving these reports that their usefulness is definitely restricted because the data upon which they are based cover only a single year. Despite this fact, however, and the further fact that normal conditions do not prevail in the industry at this time, the information should prove helpful since it indicates the quantities of the various commercial classes of dry beans and canned dry beans distributed in different sections of the country by nearly half of the wholesale grocery agencies in the United States during a representative 12-month period.

Importance of United States Dry Bean Crop

For the country as a whole dry beans represent only about 1 percent of the gross income from all, crops, but for certain States they constitute an important source of farm income. About 60 percent of the dry beans grown in the United States are produced in Michigan and California, 2/ and the cooperatives with the largest volume are located in those States. In California, for example, cooperatives handle about two-thirds of the standard lima bean crop and in Michigan cooperative volume amounts to about 30 percent of the State's total dry bean production. Other States with important cooperative volume include New York, Colorado, Idaho, Wyoming, and New Mexico. The annual production of dry beans in these seven States amounts to about 90 percent of the total United States crop.

Each of the States which produce dry beans commercially tends to specialize in the production of particular varieties or commercial classes. Thus, Michigan and New York lead in the production of pea beans; Colorado and New Mexico are first in pinto production; California produces all the dry limas grown in this country; and Idaho and Wyoming are our principal source of Great Northerns.

^{2/} Production, Farm Disposition, and Value of Beans, 1909-37 - U. S. Dept. of Agr. Marketing Service, 1940 (Mimeo).

Table 1 3/ shows the production of dry beans by States for the 11 years ending with 1939, together with the 1929-38 annual average. Table 2 shows the production in 1939 of the several commercial classes of beans by States.

Marketing Dry Beans Cooperatively

The system of marketing dry beans is similar to that employed in marketing many other agricultural products. It includes the local elevator or shipper, warehouseman, wholesaler, and retailer. Obviously, in the case of canned dry beans the cannery represents a necessary step between the producer and the consumer.

The services performed by bean cooperatives are embraced generally within the first two functions just mentioned. The cooperatives usually operate one or more elevators at which beans are received from producers and put in marketable condition. There with special machines and other equipment the local elevator removes small stones, particles of dirt, and other foreign material not taken out in threshing. Also, defective and discolored beans are removed to make the quality conform to an established grade. In some cases it may be necessary to polish the cleaned beans to bring about this result. Sometimes after initial cleaning at the local elevator, beans are shipped to terminal elevators for further processing and storage.

Some cooperatives confine their activities to those functions usually performed by local elevators. Others render a complete service to producers all the way to the wholesale grocers, the canners, and other large-scale buyers.

Dry beans are packaged ordinarily by the grocery agencies themselves. However, some of the large dry bean cooperatives are performing this service in increasing volume, either for the wholesalers in their own packages or in the packages of the cooperatives.

Some of the cooperatives are giving increased attention to the canning of dry beans. For instance, the California Lima Bean Growers Association, Oxnard, California, has a substantial volume of the beans delivered by its producers canned each year. This is done under contractual arrangement with several canneries. In order to insure a quality product the association selects the type and quality of the canning stock and the packing is done under its direction.

The California Lima Bean Growers Association is the oldest and one of the outstanding dry bean cooperatives in the United States. It is a federated type of cooperative, with a membership of 18 locals,

^{3/}See p. 13.

serving about 1,000 growers. Individual growers have their membership in the locals which compose and control the central association. The Lima Bean Growers Association acts as a sales agency, and all warehousing, cleaning, grading, handling, packaging, and shipping are under the direct supervision of the association's inspectors. When necessary to conform to terms of contract of sale, inspections for grade are made by Federal-State inspectors at time of shipment or delivery. The annual volume of the association amounts to about 60 percent of the California standard lima bean crop. Beans are handled by the association on a pooled basis and sales are made directly to wholesale grocers and chain-store buyers through the medium of food brokers located in the principal distributing centers in the United States and Canada.

The Michigan Elevator Exchange, Lansing, Mich., also illustrates the extensive scope of operation of the leading bean cooperatives. This association is a federation of some 80 locals, comprising three-fourths of all the farmer-owned elevators in the State of Michigan. It performs various services incident to the sale and distribution of dry beans for the local elevators, functioning for the latter generally as the locals act for individual producers. The Exchange owns and operates the largest terminal elevator in the world, which is equipped with the latest machinery for conditioning, picking, packing, and storing beans.

In the East the Cooperative Grange League Federation Exchange at Ithaca, N. Y., is handling an increasingly important volume of dry beans. This association maintains processing plants in the three principal bean-producing counties in the State of New York. Other bean cooperatives include those operating in Colorado, Idaho, Wyoming, and Montana. These associations handle a substantial volume of beans each year.

Sources of Information

A questionnaire was sent to all wholesale grocers listed in Thomas Wholesale Grocery Register for 1939 capitalized at \$50,000 or more and which conformed to the Register's Definition "A". 4/ The 3,241 wholesale agencies thus contacted represented 87 percent of the total number of concerns coming within the "A" classification. They were asked to furnish information regarding the

^{4/} The register divides wholesale concerns listed therein into two groups—those whose major business (75 percent or more) is confined to grocery lines and which conform to other conditions set forth in the register. These are designated as coming within definition "A". Those whose business is less than 25 percent groceries, and meet certain other specified conditions are listed as "Supplementary Wholesales" definition "B". In this survey reports were obtained only from the first-named group.

quantity of dry beans by commercial classes and canned dry beans, handled by them during the year ended June 30, 1940. Located in seme 800 cities throughout the country, the concerns contacted included 2,750 independent and 491 chain-store wholesales. Replies were received from 1,759 concerns. Of these, 215 were not used because the concern (a) did not handle beans, (b) had consolidated with another, (c) had gone out of business, (d) information was not available. Therefore, this report is based upon 1,544 replies, representing 47.63 percent of the wholesale agencies to which questionnaires were sent. Of the total replies received, 281 were from chain wholesales.

The wholesale grocors submitted information as to the volume of caumed beans and beans in bulk or package form distributed by them during the year covered by the survey. However, the relatively small quantity of dry beans in package form reported did not warrant inclusion separately, broken down by States and trading areas. Accordingly, dry beans in bags includes packaged dry beans.

Summary of Data Obtained

The following is a summarization of the information thus made available to us by the wholesale agencies for the year covered by the survey:

4,700,286 bags 5/ dry beans (100 pounds to bag)
5,129,925 cases pork and beans and baked beans (48 cans to case)
1,093,628 cases canned kidney beans (24 cans to case)
356,993 cases canned dry lima beans (24 cans to case)

The volume of dry beans in bags handled by these concerns represented nearly 33 percent of the 1939 crop. The 6,580,000 cases of canned dry beans reported to us was more than 25 percent of the 25,843,000 cases of dry beans canned in 1939. It is estimated 6/ that roughly 712,000 bags of dry beans were required to produce those 6½ million cases. Adding the 712,000 bags to the number of bags of dry beans sold in bulk and packages, a total of 5,412,286 bags was handled by these agencies, or a little less than 38 percent of the dry bean crop produced in 1939.

Distribution by Geographic Regions and by States

The volume of dry beans distributed by the wholesale agencies which cooperated in this survey is shown in table 3 on the basis of the nine geographic regions of the United States, together with the

^{5/} Includes dry beans in package form equivalent to 102,227 bags.
6/ Estimate supplied by the National Carmers Association.

population of those regions. With more than 18 percent of the total dry beans reported for the entire United States, the geographic region embracing the States of Arkansas, Louisiana, Oklahoma and Texas was first from the standpoint of volume of dry beans distributed. It ranked fifth in population. The geographic region which includes the States of New York, New Jersey, and Pennsylvania was first in population and second in volume of dry beans reported by the wholesalers.

Table 4 lists the several States of the Union in the order of their importance in the wholesale distribution of dry beans as shown by this survey. Some 17 States each showed a volume of more than 100,000 bags of beans distributed during the year covered by this survey, or more than three-fourths of the total for the United States. New York State was first with more than half a million bags. Ranking second in volume of dry beans distributed, the State of Texas was sixth in population. Tempessee was third in the distribution of dry beans and ranked fifteenth in population.

Major Groups of Dry Beans

The nearly 4-3/4 million bags of dry beans reported to us are divided among the three major groups of white, colored, and lima beans as follows:

| Group | Number of bags |
|--------------------------|----------------|
| White Colored Lima Other | 925,639 |

Stated on a percentage basis, the above figures indicate that of the total reported, 43 percent were white beans and 37 percent colored. This compares with the production in 1939 when 45 percent of the crop was white beans and 37 percent colored. Over an extended period of years the production of white beans has been equal to about half the United States dry bean crop. Lima beans represented about 19 percent of the total in the survey. While these groups compete to some extent, the competitive situation is reflected more definitely in the demand for the various commercial classes into which these major groups are divided and under which dry beans are generally seld.

Commercial Classes of Dry Beans

The general crop reports of the United States Department of Agriculture list 14 commercial classes of dry beans produced in this country. The 10 leading classes usually represent about 90 percent of the total United States crop. Therefore, tables 6 and 12 which

show, respectively, the distribution of commercial classes of dry beans on State and trading area bases, are limited to those 10 classes and group the rest under the heading "Other Classes." Tables 5, 8, 10 and 11 show 13 classes upon which the wholesale agencies reported to us.

Each of the commercial classes differs from the others in size, color, shape, and flavor, and therefore has its own particular appeal to consumer taste and preference. Some varieties or classes are consumed more or less generally throughout the country, and the consumption of others is confined largely to specific areas. Generally, it may be said that those dry beans which come within the classification of white beans are used principally in the northern States, and that the more important demand for colored beans is in the southern States.

In table 5 the dry beans reported in this survey are shown under the general groups white, colored, and lima, and then subdivided according to commercial classes coming within each of these major groupings.

Though of somewhat diminished importance in comparison with the lead maintained in production, pea beans was the most important commercial class reported in this survey, representing 23 percent of the United States total. Pintos were next with 16 percent, limas (Standard and baby) amounted to 19 percent, and Great Northerns, 13 percent.

Table 6 shows, by commercial classes and by States, the volume of dry beans together with the volume of canned dry beans reported to us by the wholesale distributors. It is worth noting that the eight States bordering the Great Lakes, with 40 percent of the population of the United States, accounted for nearly 60 percent of the total volume of pea beans and 45 percent of the standard limas reported to us. The five States in the south-central part of the country, consisting of Kentucky, Tennessee, Arkansas, Oklahoma and Texas, representing about 8 percent of our total population, distributed 63 percent of the pintos, 42 percent of the Great Northerns, and nearly 30 percent of the baby limas. About 58 percent of the blackeyes reported to us were distributed in the Gulf States, and Georgia and Tennessee.

Comparison with Earlier Study

A survey comparable to the one upon which this report is based was conducted by the Bureau of Agricultural Economics covering the marketing season 1930-31 7/• A total of 5,344,000 bags was reported

^{7/} Distribution of Dry Beans by Commercial Classes as reported by Wholesale Greers - Compiled by J. E. Barr, Marketing Specialist, and J. A. Thompson, Junior Agronomist, U. S. Dept. of Agr., April 1932 (Mimeo).

in that study as compared with 4,598,000 bags 8/ reported in the present survey.

The 14 States for which the greatest volume was reported in 1930-31 and in 1939-40 are shown in table 7. The volume of those leading groups respectively represented about 70 percent of the total reported in each of the years covered by the two surveys, and 13 of the 14 States in the 1930-31 survey also were the leaders in 1939-40.

The volume of dry beans by commercial classes reported in both surveys is shown in table 8. With a volume of 23.4 percent of the total dry beans reported, pea beans represented the most important class in 1939-40, and amounted to only 16.9 percent of the total in 1930-31. Pintos led in 1930-31 with 25.4 percent of the total, and in 1939-40 they constituted only 16.8 percent of the total for the entire country.

It will be borne in mind that the distribution percentages for the commercial classes referred to above are in about the same ratio as the production of the specific class bears to the total production of all classes for that year. For instance, a record crop of pinto beans was produced in 1930 and this volume, with the carryover from the heavy crop in 1929, was available for marketing in the 1930-31 marketing season. Likewise the large crop of pea beans in 1939 following an even larger production of that particular class in 1938 meant extremely heavy volume for the 1939-40 marketing season. In such circumstances increased efforts of distributing agencies and others interested are directed toward the class representing largest volume.

Distribution in Wholesale Trading Areas

Like other articles of commerce, agricultural products must move from areas of production to consuming centers with reasonable efficiency, and without regard for State, county or city boundaries. Consequently, a city which is in an important distributing center frequently serves an area extending considerably beyond the boundaries of the State or county in which it is located. For example, the important marketing center of St. Louis, embraces not only practically the eastern half of Missouri, but the major portion of southern Illinois as well.

Although presentation of the information obtained in this survey would be somewhat cumbersome if shown for each of the nearly 800 cities from which reports were received, it may be shown quite easily on the basis of the principal centers of distribution.

^{8/} The 1930-31 survey did not include beans in packages. Accordingly, in this portion of the report they are emitted from the figures representing the present survey.

Fortunately, authoritative information is available as to the number of these trading areas and territory embraced in each, as a result of studies carried on by the Bureau of Foreign and Domestic Commerce of the United States Department of Commerce.

The most recent report of this character is the Atlas of Wholesale Greecy Trading Areas prepared by Elma S. Moulton in the Marketing Research Division of the Bureau of Foreign and Domestic Commerce, United States Department of Commerce, published in 1938 as Market Research Series No. 19. The Atlas is based primarily upon information furnished by the wholesale greecers themselves, supplemented by data obtained in the Consus of American Business issued by the Bureau of the Consus. A map of the United States showing the territory embraced in each of the trading areas into which the country was divided accompanied the Atlas and is the last page in this report.

Dividing the United States into 184 major wholesale grocery trading areas, the Atlas emphasizes that these trading areas are not fixed, immobile territories. It declares that changing economic conditions, changes in transportation and marketing practices, and other factors, may affect trading area patterns and necessitate adjustment in using the information it contains. To the end that confidential information may not be disclosed it has been found desirable to combine certain trading areas in this report.

Wholesale concerns whose business is national or regional in character were able generally to allocate their volume to the several trading areas in which they operate, thus permitting a more detailed breakdown of the information here presented than would have been possible otherwise. It should be borne in mind that the wholesale agency whose volume is reported for a given trading area may not have its place of business at any of the cities shown in tables arranged on a trading area basis, but at some other city in that particular area.

The quantities of the various commercial classes of dry beans and cannod beans are shown in table 12 allocated to the trading areas for which they were reported to us. The five leading drybean trading areas, as indicated by table 12 are those whose territories include respectively, New York City, Nashville, Dallas, Chicago, and Los Angeles. Scattered from the Atlantic Coast to the Pacific, and from Lake Michigan to Texas, these six areas distributed slightly more than one-fourth of the total dry beans reported in this survey. The New York City trading area distributed the largest volume, handling some 9 percent of the United States total. Next in importance were the Chicago and Knoxville trading areas, in the order named.

Packaged Dry Beans

Though many foods are available either in bulk or package form, preference for the packaged article continues to develop rapidly.

Convenience in handling, greater sanitation, and similar appeals to consumers in behalf of packaged foods apparently have been less favorably received by consumers of dry beans than other foods. At any rate, packaged dry beans reported in this survey represented only about 2 percent of the total quantity distributed. However, the figures made available to us refer to purchases of packaged beans by wholesale agencies and do not include quantities which may have been purchased in bulk and packaged by the wholesalers themselves. Incidentally, the volume of dry beans in packages sold by producer cooperatives is increasing probably because these organizations are working closely with distributing agencies in furthering the sale of beans in package form. Some of these associations sell packaged beans under their own brand names, and also package beans for sale under their customers' brands.

Because the relatively small volume of dry beans in packages reported in this survey does not warrant showing quantities by States, the figures relating to the packages are combined with those showing quantities in bags for the several States. However, as an indication of the quantity of packaged dry beans reported from the more important distributing centers, the 15 leading States are shown in table 9.

The wholesale agencies reported the equivalent of 102,227 100-pound bags of dry beans in package form. The total quantity of dry beans in packages distributed in the 15 leading States, therefore, was approximately 90 percent of the total for the United States.

Distribution by Type of Concern

Reference was made earlier to the fact that this report is based upon 1,544 replies from wholesale grocers throughout the country. Of the total replies received, 281, or slightly more than 18 percent, were from chain wholesalers, which reported the distribution of 1,966,873 bags during the year. The independents distributed 2,733,413 bags. The total quantities of the several commercial classes of dry beans distributed by the independent and chain groups, as disclosed by the reports to us, are shown in table 10.

Approximately three-fourths of the pintos and of the Great Northerns, two of the three leading classes, were handled by the independents. More than 60 percent of the pea beans, the most important commercial class, was distributed by the chain wholesales. The chains distributed nearly 42 percent of the United States total reported in this study. This means that less than one-fifth of the concerns reporting distributed more than two-fifths of the total volume shown. Table 11 shows the volume of dry beans in bags and on a percentage basis, distributed in each of the nine geographic regions of the United States by the independent and the chain whole-sale agencies.

Foreign Trade in Dry Beans

This country usually imports more dry beans than it exports. Average annual imports for the 19-year period, 1921-39, were about double the exports. However, wide fluctuations occurred during this period. In some years exports were small as compared with imports and in other years the reverse was true. In 1930 imports were three times the exports in that year, and in 1938 exports were about four times greater than the imports. Exports of dry beans in 1939-40 amounted to 793,379 bags 9/, or about 5 percent of our production in that year. Our leading customer in 1939-40 was Cuba, which took 219,251 bags. France was next with 146,014 bags, and then Sweden with 121,726 bags. Imports of dry beans in 1939-40 were less than one-half of 1 percent of the United States production in 1939. United States foreign trade in dry beans during the 11-year period onding in 1939 is shown in table 13.

Purchases of Dry Beans in Surplus Removal Program

The purchases by the Federal Government under the surplus removal and relief programs removed substantial quantities of beans from regular distribution channels during the year ending June 30, 1940. While such purchases did not add to the volume handled by the wholesale distributing agencies, it should be mentioned that nearly 30,000,000 pounds of dry beans were purchased by the Federal Government for relief distribution during that year. Of these quantities, there were actually distributed to the various States by the Surplus Marketing Administration during the year ending in June 1940, 22,433,488 pounds of dry beans, including 663,488 pounds of dry lima beans.

In addition to the above, nearly 7,950,000 pounds of dry beans moved into consumption during the year ended June 30, 1940, under the food stamp plan.

^{9/} Production and Trade - Dry Beans, 1939-40, prepared by M. A. Wulfert, Vegetable Specialist, Bureau of Foreign and Domestic Commerce, U. S. Dept. of Commerce.
